PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

SUBUNIT: INTERACTS WITH GLYCOGEN SYNTHASE KINASE-3 BETA (GSK-3B)
AND BETA-CATENIN. THE INTERACTION BETWEEN AXIN AND BETA-CATENIN
OCCURS VIA THE ARMADILLO REPEATS CONTAINED IN BETA-CATENIN.
TERNARY COMPLEX (BY SIMILARITY).
SUBCELLULAR LOCATION: CYTOPLASMIC.
TISSUE SPECIFICITY: EXPRESSED IN BRAIN AND LYMPHOBLAST.
PYM: PROBABLY PHOSPHORYLATED BY GSK-3B AND DEPHOSPHORYLATED BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: CONTAINS 1 RGS DOMAIN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-98151361; PubMed-9482734;
RA Ikeda S., Kishida S., Yamamoto H., Murai H., Koyama S., Kikuchi A.;
RT "AXIn, a negative regulator of the Wnt signaling pathway, forms a
rt complex with GSK-3beta and beta-catenin and promotes GSK-3beta-
rt dependent.phosphorylation of beta-catenin.";
RL EMBO J. 17:1371-1384(1998).

C. I- FUNCTION: INHIBITOR OF THE WNT SIGNALING PATHWAY. DOWN REGULATES
RETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-
C. CATENIN AND APC BY GSK-3B (BY SIMILARITY).
C. CATENIN AND APC BY GSK-3B AND BETA-CATENIN. THE INTERACTION
RETWEEN AXIN AND BETA-CATENIN OCCURS VIA THE ARMADILLO REPEATS
C. CONTAINED IN BETA-CATENIN. TERNARY COMPLEX. ALSO BINDS TO
PLAKOGLOBIN (GAMMA-CATENIN). APC, DUL AND PP2A (BY SIMILARITY).
C. TISSUE SPECIFICITY: HIGHLY EXPRESSED IN TESTIS, THYMUS AND LUNG
FOLLOWED BY CEREBRUM, CEREBELLUM, HEART, KIDNEY, SKELETAL MUSCLE,
SPLEEN AND LIVER.
C. PART DE STATE OF THE STATE OF THE SPLEEN AND LUNG
SPLEEN AND LIVER.

J. Biol. Chem. 272:8679-8685(1997)
-1- FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE ACTIVITY OF G PROTEIN ALPHA SUBUNITS THERBBY DRIVING THEM INTO THEIR INACTIVE GDP-BOUND FORM. MAY PLAY A ROLE IN LEUKEMOGENESIS.
-1- TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.
-1- SIMILARITY: CONTAINS 1 RGS DOMAIN.

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                   Tumor-suppressing protein conductin

                      Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                        Claim 8;

                                                                                                                                                  likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.
                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Axin; cancer; breast cancer; colorectal cancer;

                                 E. colony transformants contg. Candida antarctica lipase A, chromosomal DNA of the C. antarctica strain LF058 (DSM 3855) were prepd. The colonies are screened with the 32P-phosphorylated oligo degenerate probe NOR 440, based on the N-terminal sequence determined from mature C. antarctica lipase. Plasmids were prepd. If from positive colonies and analysed by southern hybridisation. The probe for the southern is either the NOR 440 probe or a 32P-labelled probe NOR438. NOR 438 is an oligo corresp. to AA sequence of the lipase in which, at 13 posns., a base has been chosen on the basis of codons used in yeasts and filamentous fungi. (Guess positions are indicated in 094949 FT). Only one plasmid, pMT1076, contains a band which hybridises both to NOR 440 pmT1076 is restriction mapped and sequenced (see 094950). The last two AAs of the propeptide (see R78230) are a typical cleavage site for endoproteolytic processing by enzymes of the S. Cerenitains with the propeptide (see R78230) are a typical cleavage site for endoproteolytic processing by enzymes of the S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      кеу

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the C. antartica lipase A protein. This lipase has high thermostability and is active at acid pH. A varies of the mature lipase A in which hel39 has been replaced by a Trp residue has increased specific activity compared to the parent lipase. The lipase or varient may be used in ester hydrolysis, ester synthesis or interesterification. They can also be used for avoiding pitch trouble in the process for the production of mechanical pulp or a paper-making process using mechanical pulp. They can also be used in detergents or as a digestive enzyme, eg. it the treatment of cystic fibrosis.

This sequence represents the Lactococcus lactis HsdR subunit. Nucleic acids encoding the HsdR, HsdM or HsdS fragment can be used for expression of at least one bacteriophage
                                                                                                                         calcium release activated channel; therapy; diagnosis; lymphocyte proliferative disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a Caenorhabditis elegans polypeptide at the c05c12.3 locus. The polypeptide was identified in a database search for putative calcium channel proteins. The C05c12.3 protein was noteable cause its central pore region had some similarity to, but was clearly distinct from, members of the Trp family of calcium chennels. The polypeptide was used in BLAST screening to isolate 2 other C. elegans homologues (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New SOC/CRAC calcium channel polynucleotides and polypeptides used to diagnose and treat proliferative disorders associated with the channel and to screen for novel modulators of the channel -
Isolated nucleic acid molecule encoding a human secreted protein

The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such

     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score
